xtarea: To configure your Git account with your name and email, you can use the following Git commands in your terminal or command prompt: 1. ****Set Your Name****: Replace `"Your Name"` with your actual name. This name will be associated with your Git commits. ````bash git config --global user.name "Your Name" ```` 2. ****Set Your Email****: Replace `"your.email@example.com"` with your actual email address. This email will be associated with your Git commits. ````bash git config --global user.email "your.email@example.com" ```` After running these commands, your Git account will be configured with your name and email globally (`--global`` flag sets the configuration globally for all repositories on your system). These settings are used when you make commits to any Git repository on your machine unless you override them locally in a specific repository.
